Veneer Smoothing Tool

Using the Veneer Smoothing Tool

The Veneer Smoothing Tools offered by WalzCraft, can be used to apply Non Adhesive Refacing Materials using contact cement or Pressure Sensitive Adhesive (PSA). Surfaces must be prepared correctly based on the material you are applying, please review manufacturer's instructions.

- Constant pressure must be applied over the entire surface
- Starting at the center of the surface, pull the tool toward you while going in the same direction as the grain. Apply pressure with both hands, applying as much downward pressure as possible.
- Keep doing this as you move over 3-4 inches at a time until you have smoothed down the entire surface.

If working with refacing material, protect the finished surface with a thin piece of material, like a piece of plastic laminate. The pressure you exert will transfer through.

Adhesive and pressure are key to the desired bond.
